

CML3112 — Week 2 Practical

Proof of Life & Notebook State

STUDENT ID

25/UG/135/BSCE-J

COURSE

Civil Engineering ML

WHAT THIS SUBMISSION IS ABOUT

Hi! This is my submission for the Week 2 practical. In this task, I set up my Python environment, demonstrated how notebook execution order works, and loaded structural inspection data from a CSV file.

FILES IN THIS REPOSITORY

- `25_UG_135_BSCE-J_W02.ipynb` — The main Jupyter notebook with all code cells and outputs.
- `site_inspection_log.csv` — A small dataset containing 4 structural crack width measurements.
- `README.md` — This brief overview file.

QUICK NOTE ON NOTEBOOK STATE

Why did `readings` change when running the cell multiple times?

Jupyter notebooks keep variables stored in memory. Every time I hit run on `readings = readings + 5`, it kept adding 5 to the existing total. When selecting *Restart & Run All*, everything reset and ran top-to-bottom, giving the clean expected answer of `17`.

HOW TO TEST

Open the notebook in Google Colab and click **Runtime > Restart and Run All** to see all cells execute smoothly from start to finish.
